The aromatic compound (of a specified formula) can be binding domain. The aromatic compound (of a specified formula) can be used to increase alpha-gllerophosphate dehydrogenase (GPDH) levels, at levels which do not significantly modify cardiac GPDH levels and are indicated in the treatment of obesity. The compound also lower total plasma cholesterol and triglyceride levels and can be used as antipaperinglyceridaemic agents. The compound may also be used for treating atherosclerosis and may be indicated in thyroid hormone replacement therapy in patients with compounds cardiac function.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8
                                                                                                                                                                                                                                                                                                                                     The present invention relates to ligand dependent transcriptional factors including oestrogen receptor (ER) alpha and beta protein, glucocorticoid receptor protein (RR), mineralocorticoid receptor protein (RR), present activated receptor protein (RR), progretor protein (RR), present receptor protein (RR), present receptor protein (PRR), present receptor protein (PRR), present receptor protein (PRR), thyroid hormone receptor protein (PRR), thyroid hormone receptor protein (RR) and vitamin D receptor protein (VRR), the nucleic receptor protein (PRR), the nucleic gene for the ligand dependent transcriptional factor. These proteins are useful in the modulation of ligand dependent transcriptional factor. Cartivity The cells, mutant ERalpha and the polynucleotide encoding it may be used in assays for qualitatively analysing an activity for transactivation of a reporter gene by a test ERalpha, for screening transcriptional factors, for evaluating an activity for transactivation of a reporter gene by a test ERalpha and/or for presenting and recent gene by a test ERalpha and/or for presenting and recent gene by a test ERalpha and/or for presenting and recent gene by a test ERAlpha and/or for the protein screening and screen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1;
                                                                                                                                                                                                                                    Ligand dependent transcriptional factors, nucleic acids encoding them and cells comprising them and a specified reporter gene, useful for screening agents for the treatment of breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   239
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             305 SLALSLTADQWVSALLDAEPPILYSEYDPTRPFSEASMMGLLTNLADRELVHMINWAKRV 364

The present invention relates to ligand dependent transcriptional factors including osstrogen receptor (ER) alpha and beta protein, glucocorticoid receptor protein (RR), mineralocorticoid receptor protein (RR), progesterone protein (PR), mineralocorticoid receptor protein (PRR), receptor protein (PRR), thyroid hormone conditions them and cells comprising them and a specified reporter gene for the ligand dependent transcriptional factor. These proteins are useful in the modulation of ligand dependent transcriptional factor activity. The cells, mutant ERAlpha and the polynucleotide encoding it may be used in assays for qualitatively analysing an activity for transactivation of a reporter gene by a test ERAlpha, for screening mutant ligand dependent transcriptional factors, for evaluating an activity for transactivation of a reporter gene by a test ERAlpha and/or for screening activity for transactivation of a reporter gene by a test ERAlpha and/or for screening activity for transactivation of a reporter gene by a test ERAlpha and/or for screening activity for transactivation of a reporter gene by a test ERAlpha and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ligand dependent transcriptional factors, nucleic acids encoding them and cells comprising them and a specified reporter gene, useful for screening agents for the treatment of breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Chambon P, Metzger D;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 2002-463217/49.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           N-PSDB; ABL57497.
The present invention relates to ligand dependent transcriptional factors including oestrogen receptor (ER) alpha and beta protein, glucocorticoid receptor protein (RR), mineralecorticoid receptor protein (RR), present activated receptor protein (RR), present receptor protein (RR), present receptor protein (RR), present receptor protein (PRR), the nucleic receptor protein (PRR), the nucleic receptor protein (RR), the nucleic receptor protein (VRR), the nucleic receptor protein (RR), and vitamin D receptor protein (VRR), the nucleic receptor protein (PRR), the nucleic gene for the ligand dependent transcriptional factor. These proteins are useful in the modulation of ligand dependent transcriptional factor activity. The cells, mutant ERalpha and the polynucleotide encoding it may be used in assays for qualitativaly analysing an activity for transactivation of a reporter gene by a test ERalpha, for screening mutant ligand dependent transcriptional factors, for evaluating an activity for transactivation of a reporter gene by a test ERalpha and/or for screening a compound useful for treating a disorder of a mutant

metazoan organism, especially a transgenic mouse, characterised in that
at least one cell comprises: (i) a fusion protein formed from a
cecombinase (Creb, a hinge region (preferably human (I) D hinge), and a
cecombinase (Creb, a hinge region (preferably human (I) D hinge), and a
compliced ligand binding domain (LBD) of a nuclear osetrogen receptor,
cespecially human (I), its fragment or variant; and (ii) one or more genes
cor DNA sequences of interest belonging to the genome of the organism,
cinto which one or more recognition sites of the recombinase protein are
the cinearted. The (I) LBD domain is preferably modified by a G521R, G400V, or
combinase activity in the presence of a natural ligand such as
coetradiol, but recombinase activity is induced by a small quantity of a
synthetic ligand that has antioestrogenic activity, e.g. tamoxifen or 4-
cydroxytamoxifen. The metazoan organism or its cells, such as epidermal
cells, hepatcoytes or adipocytes, are useful in carrying out a
chinterset in its natural chromatin environment. It is also used in
certeening of medicaments for pathological conditions associated with an
calteration of the expression and/or function of the DNA sequence of
therefore the sextine and/or function of the DNA sequence of
therease, such as skin cancer, inflammation, diabetes, alopecia, obesity,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   in promoting hepatic regeneration

This invention relates to a novel method of determining whether a patient has an increased risk for developing a disease or disorder which comprises determining the presence of a mutation or polymorphism in the patient of patient or in a cell of the patient. The invention may polymorphide in the patient or in a cell of the patient. The invention may be useful for the development of compounds with an antibacterial.

Co disorders-Gen, gastrointestinal-Gen, cytostatic, dermatological, eatingmunosuppressive, muscular-Gen, cytostatic, dermatological, eatingmunosuppressive, muscular-Gen, nephrotropic, osteopathic or virucide activity. The method is useful for determining whether a patient has an increased risk for developing a disease or disorder. The nucleic acid cencoding a nuclear receptor polypeptide, an expression vector comprising the nucleic acid operably linked to a promoter, or a compound that cencoding a nuclear setup for treating or preventing a disease or disorder of the adrenal gland, colon, cardiovascular, intestine, kidney, liver, lung, muscular, covary, blood, prostate, skin, spleen, stomach, testes, thymus, thyroid, uterus, pancreas, bone and joints, breast, or immune system, or metabolic or nutritive disease or disorder. The present sequence is that of a nuclear receptor protein which may be used in the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention comprises the amino acid sequences of mutant human oestrogen receptor-alpha (ER) proteins. The mutant ER proteins of the invention are useful for determining the effectiveness of a treatment by an ER activity regulator substance, and for determining the effectiveness of a treatment by an anti-oestrogen substance. The present amino acid sequence represents the wild-type human ER protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     120

The invention comprises the amino acid sequences of mutant human oestrogen receptor-alpha (ER) proteins. The mutant ER proteins of the invention are useful for determining the effectiveness of a treatment by an ER activity regulator substance, and for determining the effectiveness of a treatment by an anti-oestrogen substance. The present amino acid sequence represents a human ER protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           239

Designing a homology model of the ligand binding domain of a glucocorticoid receptor displayed as a three-dimensional image, useful for identifying agonists and antagonists for treating e.g. inflammation, hypertension, glaucoma, diabetes.

Disclosure; Fig 6; 246pp; English.

This invention relates to a method for designing an homology model of the ligand binding domain of a glucocorticoid receptor. The homology model may be displayed as a three-dimensional image. The method comprises: (a) providing an amino acid sequence and an x-ray crystallographic structure to take of the ligand binding domain of a thyroid, oestrogen or progesterone creeptor; (b) modifying the x-ray crystallographic structure to take account of differences between the amino acid configuration of the ligand binding domain of the glucocorticoid receptor and the thyroid, oestrogen, or progesterone receptor; (c) verifying the accuracy of the homology confided by comparing it with experimentally-determined binding properties of a number of ligands for the glucocorticoid receptor; and (d) modifying confided by comparing it with experimentally-determined binding properties of a number of ligands for the glucocorticoid receptor; and (d) modifying confidence of ligands for the glucocorticoid receptor; and designing ligands confidence of inflammation and also in immunosuppressive therapy. The identified agonists are useful for the treatment of hypertension, diabetes, and wounds the homology models are also useful for electronic screening of compound datebases, de novo drug design and/or prediction of binding confinities of glucocorticoid receptor models produced using molecular mechanics scoring functions. The prediction of the correction contains produced using co-ordinate data for the glucocorticoid receptor models produced using coestrogen and progesterone receptors. The present sequence repetore of the method of the invention for homology modelling of a glucocorticoid creceptor for the coestrogen and progesterone receptors. The present sequence repetored using method of the invention for homology modelling of a glucocorticoid creceptor for the glucocorticoid receptors are sections. The present sequence repetored using method of the invention for homology model is useful for the glucocorticoid receptor for the glucocor

"Screening for ESR mutations in breast and ovarian cancer patients."; Hum. Mutat. 9:531-536(1997).

-! FUNCTION: Nuclear hormone receptor. The steroid hormones and their receptors are involved in the regulation of eukaryotic gene expression and affect cellular proliferation and differentiation in Larget tissues.

-!- SUBDNIT: Binds DNA as a homodimer. Binds UBEIC (By similarity).

Can form a heterodimer with ESR2. Interacts with NCOA3, NCOA5 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   "The structural basis of estrogen receptor/coactivator recognition and the antagonism of this interaction by tamoxifen."; cell 95:927-937(1998).

Interacts with NCOA3 and NCOA6 coactivators, leading to a strong increase of transcription of target genes. Interacts with NCOA5. Binds UBEIC (By similarity).

-!- SUBCELUIAR LOCATION; Nuclear.
-!- DOMAIN: Composed of three domains: a modulating N-terminal domain, a DNA-binding domain and a C-terminal steroid-binding domain.
-!- PTM: Phosphorylated by cyclin A/CDK2 (By similarity).
-!- MISCELLANBOUS: In the absence of ligand, steroid hormone receptors are thought to be weakly associated with nuclear components; hormone binding greatly increases receptor affinity. The hormone-receptor complex appears to recognize discrete DNA sequences upstream of transcriptional start sites.
-!- SIMILARITY: Belongs to the nuclear hormone receptor family. NR3
                                                                                                                                                                                                                                                                                                                                                                                                                                         FUNCTION: Nuclear hormone receptor. The steroid hormones and their receptors are involved in the regulation of eukaryotic gene expression and affect cellular proliferation and differentiation in target tissues.

SUBUNIT: Binds DNA as a homodimer. Can form a heterodimer with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      R EMBL; A410621, GRAFEZSB111; -.

```
1 target tissues.

1 target tissues.

2 -1- SUBUNIT: Binds DNA as a homodimer. Can form a heterodimer with ERR2. Interacts with NCOA3, NCOA5 and NCOA6 coactivators, leading to a strong increase of transcription of target genes (By similarity). Binds UBBIC.

2 -1- SUBCELLULAR LOCATION: Nuclear.

3 -1- SUBCELLULAR LOCATION: Nuclear.

3 -1- DOWAIN: Composed of three domains: a modulating N-terminal domain.

3 -1- PTM: Phosphorylated by cyclin A/CDK2 (By similarity).

3 -1- PTM: Phosphorylated by cyclin A/CDK2 (By similarity).

4 -1- PTM: Phosphorylated by cyclin A/CDK2 (By similarity).

5 -1- PTM: Phosphorylated by cyclin A/CDK2 (By similarity).

5 -1- PTM: Phosphorylated by cyclin A/CDK2 (By similarity).

5 -1- PTM: Phosphorylated by cyclin A/CDK2 (By similarity).

5 -1- PTM: Phosphorylated by cyclin A/CDK2 (By similarity).

5 -1- STMILARITY: Belongs to the nuclear hormone receptor family. NR3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This SWISS-PROT entry is copyright. Endocrinol. 104:163-172(1994).

VENCTION: Nuclear hormone receptor. The steroid hormones and their receptors are involved in the regulation of eukaryotic gene expression and affect cellular proliferation and differentiation in target tissues (By similarity).

SUBNUIT: Binds DNA as a homodimer. Can form a heterodimer with BSR2. Interacts with NCOA3, NCOA5 and NCOA6 coactivators, leading

DOMAIN: Composed of three domains: a modulating N-terminal domain, a DNA-binding domain and a C-terminal steroid-binding domain.

PTM: Phosphorylated by cyclin A/CDK2 (By similarity).

MISCELLANEOUS: In the absence of ligand, steroid hormone receptors are thought to be weakly associated with nuclear components; hormone binding greatly increases receptor affinity. The hormone-receptor complex appears to recognize discrete DNA sequences upstream of transcriptional start sites.

SIMILARITY: Belongs to the nuclear hormone receptor family. NR3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 SLALSLTADOMVSALLDAEPPILYSEYDPTRPFSEASWMGLLTNLADRELVHMINWAKRV

SUBCELLUIAR LOCATION: Nuclear.

DOMAIN: Composed of three domains: a modulating N-terminal domain, a DNA-binding domain and a C-terminal steroid-binding domain.

SIMILARITY: Belongs to the nuclear hormone receptor family. NR3

L Submitted (JAN-1999) to the EMBL/GenBank/DDBJ databases.

L Submitted (JAN-1999) to the EMBL/GenBank/DDBJ databases.

Teceptors are involved in the regulation of eukaryotic gene repression and affect cellular proliferation and differentiation in target tissues (By similarity).

C SUBUNIT: Binds DNA as a homodimer. Can form a heterodimer with ESR2. Interacts with NCOA3, NCOA5 and NCOA6 coactivators, leading to a strong increase of transcription of target genes.Binds UBBLC (By similarity).

C -- SUBCELLULAR LOCATION: Nuclear.

C -- SUBCELLULAR LOCATION: Nuclear.

C -- DOMAIN: Composed of three domains: a modulating N-terminal domain, a DNA-binding domain and a C-terminal steroid-binding domain.

C -- SIMILARITY: Belongs to the nuclear hormone receptor family. NR3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DOMAIN: Composed of three domains: a modulating N-terminal domain, a DNA-binding domain and a C-terminal steroid-binding domain. SIMILARITY: Belongs to the nuclear hormone receptor family. NR3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MEDLINE=97163508; PubMed=9010328; MEDLINE=97163508; PubMed=9010328; MEDLINE=97163508; PubMed=9010328; MEDLINE=97163508; PubMed=9010328; Arnold A.P., Campagnoni A.T.; Zebra finch estrogen receptor cDNA: cloning and mRNA expression."; Steroid Biochem. Mol. Biol. 59:135-145(1996).

- FUNCTION: The steroid hormones and their receptors are involved in the regulation of eukaryotic gene expression and affect cellular proliferation and differentiation in target tissues.

-- SUBGNIT: Binds DNA as a homodimer. Can form a heterodimer with ER beta (By similarity).

-- SUBCELLULAR LOCATION: Nuclear.
                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Poephila guttata (Zebra finch) (Taeniopygia guttata).

D J. 5:891-897 (1986). FUNCTION: The steroid hormones and their receptors are involved in the regulation of eukaryotic gene expression and affect cellular proliferation and differentiation in target tissues. SUBUNIT: Binds DNA as a homodimer. Can form a heterodimer with ER-
                                                                                                                                                                                         -!-SUBCELLULAR LOCATION: Nuclear.
-!- DOMAIN: Composed of three domains: a modulating N-terminal domain, a DNA-binding domain and a C-terminal steroid-binding domain.
-!- MINGELLANEOUS: In the absence of ligand, steroid-binding domain.
-!- AINCELLANEOUS in the absence of ligand, steroid hormone receptors are thought to be weakly associated with nuclear components; hormone binding greatly increases receptor affinity. The hormone-receptor complex appears to recognize discrete DNA sequences upstream of transcriptional start sites.
-!- SIMILARITY: Belongs to the nuclear hormone receptor family. NR3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GO: GO:0016585; C:chromatin remodeling complex; ISS.

WPI; 2003-156794/15. N-PSDB; AAD53875 New mutant estrogen receptor ligand binding domain capable of interacting with non-endogenous ligand, useful e.g. in combination with a ligand for constructing selective molecular gene switches for regulating gene

Example 4; Page 117-118; 159pp; English.

function.

The invention relates to a mutant osstrogen receptor (ER) alpha-ligand binding domain (LBD) which comprises an amino acid modification in region 1, region 2 or both and interacting with a non-endogenous ligand as a result of the amino acid modification. Sequences of the invention are useful for treatment of genetic diseases, acquired diseases and any other conditions including cell proliferative disorders such as cancer e.g.

are useful for the preparation of therapeutic agents for treating cancer, osteoporosis and other bone disorders, Alzheimer's disease and cardiovascular diseases

adenocarcinomas and other malignancies such as colon cancers, renal-cell carcinoma, prostate cancer, non-small cell carcinoma of the lung, cancer of the small intestine and cancer of the oesophagus. The invention is useful for constructing selective molecular gene switches for regulating gene function in plants and transgenic animals. It is also useful in gene therapy. The present sequence is human ER alpha LBD -zinc finer array (C7) fusion protein
                                                                                                                                                                                                                                                                                                                                                      240

and cardiovascular diseases.

```
1;
The invention relates to a mutant oestrogen receptor (ER) alpha-ligand binding domain (LBD) which comprises an amino acid modification in region 1, region 2 or both and interacting with a non-endogenous ligand as a result of the amino acid modification. Sequences of the invention are useful for treatment of genetic diseases, acquired diseases and any other conditions including cell proliferative disorders such as cancer e.g. lung, breast, lymphoid, gastrointestinal, genito-urinary tract adenocarcinomas and other malignancies such as colon cancers, renal-cell carcinoma, prostate cancer, non-emall cell carcinoma of the lung, cancer of the small intestine and cancer of the osophagus. The invention is useful for constructing selective molecular gene switches for regulating gene function in plants and transgenic animals. It is also useful in gene therapy. The present sequence is human ER alpha LBD -zinc finer array

                                                  The present invention relates to a human estrogen receptor (hER)-alpha isoform. Molecules which modulate the activity of the estrogen receptor are useful for the preparation of therapeutic agents for treating cancer, osteoporosis and other bone disorders, Alzheimer's disease and cardiovascular diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel two hybrid detection method comprising fusing two proteins with a DNA binding sequence and a transcription activation sequence respectively for detecting interaction of the proteins in mammalian cells.
                                                                                                                                                                                                               9

                   The present invention describes a method for detecting the interaction of a first and a second protein within a mammalian cell. The method comprises a fusion protein of the first protein with two or more transcription activation sequences (which may be the same or different), and a fusion protein of the second protein with a DNA-binding sequence. These are expressed in a mammalian cell containing DNA carrying a reporter gene downstream of a sequence binding to the DNA-binding sequence, and the expression of the reporter gene is detected to indicate interaction of the two proteins. The method is useful for the mammalian cell, and screening of potential interactions within the mammalian cell, and screening of potential drugs targeting them. The present sequence represents a hybrid protein from an example given in the

The aromatic compound (of a specified formula) can be used to increase alpha-gleerophosphate dehydrogenase (GPDH) levels, at indicated in the treatment of obesity. The compound also lower total plasma cholesterol and triglyceride levels and can be used as anti-hypertriglyceridaemic agents. The compound may also be used for treating atheroselerosis and may be indicated in the indicated to the compound the present the compound the present of the compound the passes of the passes

The present invention relates to ligand dependent transcriptional factors including oestrogen receptor (ER) alpha and beta protein, glucocorticoid receptor protein (GR), minerablocorticoid receptor protein (RR), progesterone protein (PR), progesterone receptor protein (PR), progesterone receptor protein (PR), progesterone receptor protein (PR), thyroid hormone receptor protein (PR), the mucleic acids encoding them and cells comprising them and a specified reporter gene for the ligand dependent transcriptional factor. These proteins are useful in the modulation of ligand dependent transcriptional factor activity. The cells, mutant ERalpha and the polymucleotide encoding it may be used in assays for qualitatively analysing an activity for transactivation of a reporter gene by a test ERalpha, for screening mutant ligand dependent transcriptional factors, for evaluating an activity for transactivation of a reporter gene by a test ERalpha and/or for screening activity for transactivation of a reporter gene by a test ERalpha and/or for screening activity for transactivation of a reporter gene by a test ERalpha and/or for screening a compound useful for treating a disorder of a mutant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ligand dependent transcriptional factors, nucleic acids encoding them and cells comprising them and a specified reporter gene, useful for screening agents for the treatment of breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  181 DTLIHLMAKAGLTLQQQHQRLAQLLLILSHIRHMSNKGMEHLYSMKCKNVVPLYDLLLEM 240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to ligand dependent transcriptional factors including oestrogen receptor (ER) alpha and beta protein, glucocorticoid receptor protein (GR), mineralocorticoid receptor protein (RR), progesterone percein (RP), mineralocorticoid receptor protein (PPR), progesterone receptor protein (PR), progesterone receptor protein (PR), progesterone creceptor protein (PR), progesterone creceptor protein (PR), progesterone acids encoding them and cells comprising them and a specified reporter gene for the ligand dependent transcriptional factor. These proteins are useful in the modulation of ligand dependent transcriptional factor.

Cativity. The cells, mutant ERalpha and the polynucleotide encoding it may be used in assays for qualitatively analysing an activity for transcriptional factors, for everening cativity for transcriptional factors, for evaluating and/or companied acceptor process for screening activity for transcriptional factors, for evaluating and/or for for evaluating and compound useful for treating a disorder of a mutant
                                                                                                                                                                                                                                                                              Ligand dependent transcriptional factors, nucleic acids encoding them and cells comprising them and a specified reporter gene, useful for screening agents for the treatment of breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   364
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PDMLLATSSRFRMMNLQGEBFVCLKSIILLNSGVYTFXXXXXXXXXEEKDHIHRVLDKIT 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to ligand dependent transcriptional factors including oestrogen receptor (ER) alpha and beta protein, glucocorticoid receptor protein (RN), mineralecorticoid receptor protein (RN), mineralecorticoid receptor protein (RN), pregnane X receptor protein (PRAR), pregnane X receptor protein (PRAR), thyoid hormone receptor protein (PRAR), pregnane X receptor protein (PRAR), thyoid hormone receptor protein (PRAR), the mucleic acids encoding them and calls comprising them and a specified reporter gene for the ligand dependent transcriptional factor. These proteins are useful in the modulation of ligand dependent transcriptional factor. These proteins are useful in the calls, mutant ERAlpha and the polynucleotide encoding it may be used in assays for qualitatively analysing an activity for transactivation of a reporter gene by a test ERAlpha, for screening mutant ligand dependent transcriptional factors, for evaluating an equivity for transactivation of a reporter gene by a test ERAlpha and/or for screening a compound useful for treating a disorder of a mutant ERAlpha, especially breast cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          igand dependent transcriptional factors, nucleic acids encoding them and cells comprising them and a specified reporter gene, useful for screening agents for the treatment of breast cancer.

Sequence 595 AA;

metazoan organism, especially a transgenic mouse, characterised in that
at least one cell comprises: (i) a fusion protein formed from a
cecombinase (Creb, a hinge region (preferably human (I) b hinge), and a
modified ligand binding domain (IBD) of a nuclear osetrogen receptor,
especially human (I), its fragment or variant; and (ii) one or more genes
cor DNA sequences of interest belonging to the genome of the organism,
into which one or more recognition sites of the recombinase protein are
the second inserved. The (I) LBD domain is preferably modified by a 6321R, 6400V, or
cecombinase activity in the presence of a natural ligand such as
coestradiol, but recombinase activity is induced by a small quantity of a
synthetic ligand that has antioestrogenic activity, e.g. tamoxifen or 4bydroxytamoxifen. The metazoan organism or its cells, such as epidermal
cells, hepatcoytes or adipocytes, are useful in carrying out a
spatiotemporally controlled site-specific recombination of a DNA sequence
of interest in its natural chromatin environment. It is also used in
creening of medicaments for pathological conditions associated with an
alteration of the expression and/or function of the DNA sequence of
interest, such as skin cancer, inflammation, diabetes, alopecia, obesity, or in promoting hepatic regeneration

```
This invention relates to a novel method of determining whether a patient has an increased risk for developing a disease or disorder which comprises determining the presence of a mutation or polymorphism in the patient of patient's gene encoding a nuclear receptor protein or measuring the expression or level of biological activity of a nuclear receptor copypositide in the patient or in a cell of the patient. The invention may be useful for the development of compounds with an antibacterial, antithyroid, cardiovascular-Gen, cytostatic, dermatological, eatingantithyroid, cardiovascular-Gen, cytostatic, dermatological, eatingantithyroid, agartointestinal-Gen, gynaecological, hepatotropic, immunosuppressive, muscular-Gen, nephrotropic, osteopath; or virucide activity. The method is useful for determining whether a patient has an increased risk for developing a disease or disorder. The nucleic acid concoding a nuclear receptor polypeptide, an expression vector comprising the nucleic acid operably linked to a promoter, or a compound that condulates the biological activity of a nuclear receptor polypeptide, is useful for treating or preventing a disease or disorder of the adrenal gland, colon, cardiovascular, intestine, kidney, liver, lung, muscular, ovary, blood, prostate, skin, spleen, stomach, testes, thymus, thyroid, uterus, pancreas, bone and joints, breast, or immune system, or metabolic or nutritive disease or disorder. The present sequence is that of a nuclear receptor protein which may be used in the method of the
                                                                                                                                                                                                                                                                                                            Determining an increased risk for e.g. colon, brain or breast disease or disorder, by detecting a mutation or polymorphism in the nuclear receptor gene, or measuring expression or biological activity level of the nuclear

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises the amino acid sequences of mutant human oestrogen receptor-alpha (ER) proteins. The mutant ER proteins of the invention are useful for determining the effectiveness of a treatment by an ER activity regulator substance, and for determining the effectiveness of a treatment by an anti-oestrogen substance. The present amino acid sequence represents the wild-type human ER protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120

The invention comprises the amino acid sequences of mutant human oestrogen receptor-alpha (ER) proteins. The mutant ER proteins of the invention are useful for determining the effectiveness of a treatment by an ER activity regulator substance, and for determining the effectiveness of a treatment by an anti-oestrogen substance. The present amino acid sequence represents a human ER protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     543

Designing a homology model of the ligand binding domain of a glucocorticoid receptor displayed as a three-dimensional image, useful for identifying agonists and antagonists for treating e.g. inflammation, hypertension, glaucoma, diabetes.

Disclosure; Fig 6; 246pp; English.

This invention relates to a method for designing an homology model of the ligand binding domain of a glucocorticoid receptor. The homology model cay be displayed as a three-dimensional image. The method comprises: (a) providing an amino acid sequence and an x-ray crystallographic structure to take account of differences between the amino acid configuration of the ligand binding domain of the glucocorticoid receptor and the thyroid, oestrogen or progesterone receptor; (b) modifying the accuracy of the homology, cor progesterone receptor; (c) verifying the accuracy of the homology, model by comparing it with experimentally-determined binding properties of a number of ligands for the glucocorticoid receptor; and (d) modifying the homology model for greater consistency with the binding properties. The homology model is useful for drug screening and designing ligands (agonists and antagonists) capable of binding to a glucocorticoid receptor. The identified agonists are useful for the treatment of phenical phenical infammation and also in immunosuppressive therapy. The identified but and also in immunosuppressive therapy and detains the homology models are also useful for electronic screening of compound databases, de novo drug design and/or prediction of binding and wounds. The homology models are also useful for electronic screening of compound databases, de novo drug design and/or prediction of binding contains enthality and phenical phenical phenical processions. The specification contains protein contains and and and arrangement and and arrangement and and experience and contains and contains and arrangement and and arrangement and and arrangement and oestrogen and progesterone receptors. The present sequence represents an oestrogen receptor protein. The protein is used in an example of the method of the invention for homology modelling of a glucocorticoid receptor based on the thyroid and oestrogen receptors.

Designing a homology model of the ligand binding domain of a glucocorticoid receptor displayed as a three-dimensional image, useful for identifying agonists and antagonists for treating e.g. inflammation, hypertension, glaucoma, diabetes.

Disclosure; Fig 2A; 246pp; English.

This invention relates to a method for designing an homology model to ligand binding domain of a glucocorticoid receptor. The homology model may be displayed as a three-dimensional image. The method comprises: (a) providing an amino acid sequence and an x-ray crystallographic structure of the ligand binding domain of a thyroid, oestrogen or progesterone ceceptor; (b) modifying the x-ray crystallographic structure to take account of differences between the amino acid configuration of the ligand binding domain of the glucocorticoid receptor and the thyroid, oestrogen, binding domain of the glucocorticoid receptor and the thyroid, oestrogen, cr progesterone receptor; (c) verifying the accuracy of the homology model for preater consistency with the binding properties of a number of ligands for the glucocorticoid receptor; and (d) modifying the homology model for greater consistency with the binding properties of a number of ligands for the glucocorticoid receptor. The identified agonists are useful for the treatment of inflammation and also in immunosuppressive therapy. The identified antagonists are useful for the treatment of antagonists are useful for the treatment of cobesity, glaucoma, depression, acquired immune deficiency syndrome (ADDS) and wounds. The homology models are also useful for electronic greening and wounds. The homology models are also useful for electronic screening of compound databases, de novo drug design and/or prediction of binding affinities of glucocorticoid receptor ligands for the receptor by

molecular mechanics scoring functions. The specification contains protein co-ordinate data for the glucocorticoid receptor models produced using the method, based on the X-ray crystallographic structure of the cestrogen and progesterone receptors. The present sequence represents the human oestrogen receptor protein. The protein is used in an example of the method of the invention for homology modelling based on the thyroid
